IN THE ABSTRACT:

Please replace the present ABSTRACT with the following
ABSTRACT:

A system, apparatus and method of positioning and sizing a window on a graphical user interface (GUI) are provided. When a user desires to open a window on the GUI, the user needs to specify a target area where the window is to be located. To specify the target area, the user has to select a first corner of the target area by placing a pointing device to a first location on the GUI and to drag the pointing device from the selected first location to a second location on the GUI. The second location is used as a second corner of the target area. After selecting the two corners of the target area, the window may be opened at the target area on the GUI. Since the window will be opened at the location of the target area, the window will be of the size of the target area.
